1 Introduction

1.1 Project Type

ZENO is a full-stack, web-based parking area rental and automated facility management platform developed using the modern MERN (MongoDB, Express.js, React, Node.js) technology stack. It operates as a centralized marketplace and operational utility for urban vehicle parking.

1.2 Purpose

The primary purpose of ZENO is to replace manual, error-prone paper logs and disjointed spreadsheets used by property managers with an automated digital ecosystem. It connects property owners who have underutilized parking slots with drivers who need secure, guaranteed parking. The system eliminates street congestion caused by circulating vehicles, automates payment settlement, and provides real-time visibility into slot occupancy. Furthermore, it enforces disciplined parking behavior through automated check-in monitoring and penalty calculations.

1.3 Target Users

ZENO is designed for three distinct user groups:

1. **Vehicle Drivers / Renters:** Commuters and visitors seeking short-term hourly parking or recurring monthly subscriptions near their destinations.
2. **Building Managers / Slot Owners:** Residential and commercial property owners who want to monetize vacant parking spaces, track occupancy, and monitor earnings.
3. **System Super-Administrators:** Platform operators responsible for verifying user credentials, overseeing payments, mediating disputes, and reviewing system-wide audit reports.

2 Functional Requirements

2.1 Home and Landing Page

The Home and Landing Page serves as the primary welcoming portal and informational showcase for the ZENO platform. Visitors are greeted with a modern hero presentation emphasizing streamlined parking discovery and real estate monetization. The page displays an interactive overview of prevailing sector rates, allowing prospective users to compare parking fees across urban districts before signing in. It provides prominent calls to action directing commuters toward immediate booking and property owners toward facility onboarding. Active account holders can also use quick-access navigation triggers

to reach their personalized consoles and active passes. This public interface establishes an engaging first impression while efficiently routing traffic toward core application services.

2.2 User Authentication and Registration

The User Authentication and Registration system manages secure identity verification and onboarding for all platform participants. New users can create accounts as either vehicle renters or parking facility owners through intuitive signup forms. The module validates email formats, enforces strong password security, and encrypts credentials using salted bcrypt hashing algorithms. Upon successful login, the server issues signed JSON Web Tokens (JWT) that preserve session state across client interactions. Role-based access control rules guarantee that administrative and host capabilities remain restricted to authorized accounts. This foundational security layer prevents unauthorized profile access while maintaining a smooth sign-in flow for regular users.

2.3 Renter Profile and Vehicle Management

The Renter Profile and Vehicle Management module allows drivers to maintain accurate personal and vehicle credentials in one place. Users can save multiple vehicles under their profile by specifying license plate numbers, vehicle models, and categories. Having pre-saved vehicle profiles accelerates the checkout workflow by populating parking passes with verified vehicle data. Drivers can also update contact information, review saved payment methods, and monitor past reservation histories. Storing verified license plates helps security staff authenticate vehicles arriving at parking gates quickly. This self-service portal creates an organized and trustworthy environment for regular commuters.

2.4 Search and Filter System

The Search and Filter system enables drivers to locate suitable parking spots matching their exact logistical criteria within seconds. Users can search by destination area, landmark name, or street address using responsive autocomplete suggestions. Filter options allow sorting by hourly price, vehicle compatibility, covered versus uncovered spaces, and user ratings. The results view switches smoothly between an interactive map perspective and a structured listing view. Inactive or fully booked facilities are flagged clearly so drivers do not waste time browsing unavailable choices. This focused discovery pipeline significantly reduces urban parking search frustration.

2.5 Map and Navigation

The Map and Navigation module provides an interactive visual representation of all registered parking premises using Leaflet mapping tools. Users can view nearby parking zones based on their current GPS coordinates or by panning across the city map. Each location pin displays the building name, exact distance, and number of available spots. Clicking a pin opens a detailed modal with driving directions and address guidance. The system updates marker states dynamically so drivers do not navigate toward fully

occupied locations. This visual approach shortens search time and makes reaching the parking facility effortless.

2.6 Listing Booking History

The Listing Booking History feature tracks recently booked parking facilities and active reservations for renters across their commuting sessions. As drivers reserve and utilize parking spaces across different facilities, the system automatically logs their recent booking records into an accessible chronological ledger. Renters can quickly inspect their past reservations, review booking timestamps, and re-book previously utilized parking bays without needing to re-enter search locations or re-apply complex filters. Each entry in the booking history displays the building name, slot designation, scheduled time window, total fare paid, and real-time status. Users can filter records by status and date or perform quick actions such as session extensions or cancellations directly from the panel. This feature streamlines expense tracking and simplifies repeat reservations for daily commuters.

2.7 Bookmarks and Favourite

The Bookmarks and Favourite feature allows drivers to save frequently visited parking spots and buildings for fast, recurring access. Users can tap a heart or bookmark icon on any parking listing card or detail view to add the facility to their personal collection. The dedicated favorites page displays saved locations with live status badges indicating current spot availability and hourly rates. Drivers who commute daily to work or frequent specific shopping centers can bypass standard searches and initiate reservations in seconds. The platform also notifies users if one of their bookmarked facilities introduces temporary promotional discounts or updates its operating hours. This personalization creates a seamless user experience tailored to the regular commuting habits of daily drivers.

2.8 Building Management

The Building Management module enables property administrators to register and maintain residential or commercial parking facilities. Administrators specify property names, physical street addresses, contact numbers, geo-coordinates, and operational guidelines. They can upload site entrance photos and define specific access rules, such as maximum vehicle height or operating hours. The module also allows managers to assign on-premise security supervisors to monitor daily gate operations. Any updates made to building metadata reflect across public renter search results immediately. This feature gives property administrators total digital authority over their physical facilities.

2.9 Slot Management

The Slot Management feature allows facility administrators to configure and control individual parking bays within each building floor. Administrators can define slot classifications, separating standard sedan spots from compact car, motorcycle, or electric vehicle

charging slots. Each slot is given a distinct label, such as Floor-1 Slot A-04, to simplify on-site navigation for drivers. Administrators can mark individual slots as active, undergoing maintenance, or reserved for VIP residents. Real-time availability badges shift status as drivers complete reservations, check in, or vacate the spot. This level of granular control optimizes parking space utilization and prevents accidental overbooking.

2.10 Bookings Feature

The Bookings module oversees the complete lifecycle of temporary vehicle parking reservations directly from managed slot interfaces. Drivers select arrival and departure times, inspect availability schedules, and confirm their slot booking with instant system validation. The system temporarily locks selected slots during checkout to prevent duplicate concurrent reservations by competing users. Once confirmed, the renter receives a booking reference code containing slot location and entry details. Renters can track active, upcoming, and past parking sessions through an organized central dashboard. This robust workflow ensures seamless coordination between arriving drivers and on-site attendants.

2.11 Dynamic Pricing

The Dynamic Pricing engine allows building owners to optimize revenue based on shifting parking demand and specific time slots. Property managers can establish standard baseline hourly rates alongside customized weekend, peak-hour, or nighttime charges. When demand in a commercial district surges during business hours, the system can apply defined surge multipliers automatically. Conversely, off-peak discount rules can be enabled to attract drivers during historically quiet evenings. Renters always review transparent, pre-calculated pricing estimates before completing any checkout. This pricing flexibility maximizes property earnings while maintaining honest pricing transparency.

2.12 Payment

The Payment feature delivers a frictionless and protected checkout experience for hourly bookings and overdue penalty fees. It integrates a reliable digital payment gateway such as Stripe to handle debit cards, credit cards, and mobile financial services. When a driver confirms a reservation, the system computes the exact payable total including applicable taxes and processing fees. All sensitive transaction details are handled through encrypted channels without saving raw card numbers on the server. After payment confirmation, the transaction record is instantly stored in the database. Both the renter and the building owner receive immediate financial updates.

2.13 Invoice Generation

The Invoice Generation module automates legal financial documentation for every completed monetary transaction. Leveraging server-side PDFKit engines, the system compiles booking duration, slot identifier, building address, and total paid amounts into a

clean PDF bill. Every invoice includes a unique serial number, timestamp, and breakdown of baseline fees versus penalties. Users can view and download invoices directly from their booking history dashboard at any time. Building managers can also generate consolidated billing statements for monthly accounting reviews. This built-in reporting guarantees compliance and eliminates manual bookkeeping errors.

2.14 Subscription

The Subscription system caters to regular daily commuters seeking uninterrupted long-term parking privileges. Users can browse weekly or monthly recurring passes for specific residential or corporate complexes. The system automatically reserves a dedicated or guaranteed slot for the entire active subscription window. Automated billing cycles notify subscribers before their renewal date to avoid abrupt service loss. If a user cancels or changes plans, the platform updates slot availability immediately upon term expiration. This setup provides predictable revenue for property managers and peace of mind for daily drivers.

2.15 Check In/Out

The Check In/Out system governs the physical arrival and departure verification of vehicles at parking facilities. Facility attendants or automated gate scanners validate arriving drivers using their unique reservation reference codes. Confirming a check-in logs the exact arrival timestamp and switches the slot status to active occupancy in real time. When the driver prepares to leave, the check-out action records the departure time and immediately computes whether the parking session stayed within the reserved window. In cases where a vehicle exceeds its booking duration, the system automatically calculates the overstay fee and prompts instant settlement before gate clearance. Once check-out is complete, the parking bay is released instantly into the public marketplace for incoming drivers.

2.16 Overstay Detection and Penalty System

The Overstay Detection and Penalty System ensures fair parking turnover by discouraging drivers from exceeding their booked duration. The platform continuously compares active reservation end times against physical vehicle check-out records. When a vehicle remains parked past a designated grace period, the system flags the booking as an active overstay. Automatic incremental penalty charges are calculated according to the facility's published overstay rate policy. Renters receive automated alert warnings urging them to extend their reservation or vacate immediately. Outstanding fines must be cleared before the driver can initiate subsequent parking reservations.

2.17 Reviews and Ratings

The Reviews and Ratings system establishes accountability and service quality across all registered parking facilities. Once a completed booking finishes, drivers are invited to

submit a star rating alongside a written feedback comment. Renters can comment on lighting conditions, security personnel behavior, accessibility, and slot cleanliness. Building owners can view their aggregate satisfaction score and publicly reply to constructive feedback. Highly rated buildings receive greater prominence across general search listings. This feedback mechanism promotes transparency and helps new drivers choose trustworthy locations.

2.18 Booking History

The Booking History module delivers an organized chronological ledger of all parking reservations made by a user. Renters can easily navigate between upcoming, active, completed, and cancelled reservations through intuitive status tabs. Each reservation record shows building details, slot designations, vehicle license plates, arrival times, and total costs paid. From this view, drivers can download official PDF receipts, submit post-parking ratings, or request booking cancellation if plans change. The screen also provides a convenient re-book shortcut, allowing frequent commuters to reserve their favorite parking bays again with a single click. This complete transparency ensures users always retain a reliable audit trail for their commuting expenses and personal record-keeping.

2.19 Notification and Alert System

The Notification and Alert System keeps all platform participants informed of critical events through timely digital messages. Renters receive automated reminders thirty minutes prior to booking expiration to help them avoid inadvertent overstay penalties. Property managers receive instantaneous alerts whenever a new reservation, payment settlement, or cancellation occurs in their buildings. Notifications are dispatched via both in-app notification bells and automated email messages using Nodemailer services. Important administrative announcements regarding system maintenance or policy updates are pushed platform-wide. This reliable communication network keeps users updated without requiring constant manual page refreshes.

2.20 Owner Dashboard

The Owner Dashboard provides facility owners and parking hosts with a comprehensive operational command center for their registered properties. Property owners can track real-time slot occupancy across multiple floors and see exactly which bays are currently in use. The dashboard aggregates essential business statistics, including daily earnings, weekly booking volumes, and projected payout totals. Owners can quickly view a roster of currently parked vehicles and incoming reservations for their building. Integrated controls enable hosts to adjust baseline pricing rules, trigger manual maintenance blackouts, or update parking slot configurations directly. This unified interface saves property managers significant administrative time by replacing scattered manual paperwork with a live, automated overview.

2.21 Reports and Export System

The Reports and Export System provides facility administrators with actionable financial and operational intelligence. Property managers can generate structured analytical summaries covering occupancy percentages, peak usage hours, and total revenue collections. Data can be filtered across custom date intervals, individual building floors, or specific parking slot types. The module allows managers to export clean tabular reports into standard CSV and Excel formats for offline audits. Visual bar and line charts make financial trends and revenue dips immediately apparent to stakeholders. These analytical tools empower property owners to make informed business decisions based on factual usage data.

2.22 Admin Control Panel

The Admin Control Panel serves as the central command dashboard for system super-administrators overseeing platform health. It aggregates high-level analytics, including total active reservations, platform-wide revenue volume, and total registered vehicles. Administrators possess authorization to verify newly registered building owners and audit suspicious user accounts. The control panel includes moderation tools to resolve disputed payments or investigate flagged user reviews. Real-time diagnostic logs and activity timestamps help administrators maintain operational security and platform integrity. This comprehensive console guarantees complete oversight over day-to-day platform activity.

3 Non-Functional Requirements

3.1 Performance

The platform must respond to user requests efficiently under ordinary and peak traffic loads. Server API endpoints should process standard search and booking requests within 500 milliseconds. Map marker rendering and filter updates must execute smoothly without perceptible frame stutter on the client browser. Database queries for slot occupancy verification must be optimized with appropriate indexes to prevent latency during check-out.

3.2 Security

Security and data protection are paramount across all operational layers of ZENO. All client-server communication must be securely encrypted via Transport Layer Security (HTTPS). User passwords must be securely hashed using salted bcrypt algorithms prior to database storage. Access to sensitive routes must be guarded by verified JSON Web Tokens (JWT) enforcing strict Role-Based Access Control (RBAC). Payment credentials must never be stored on internal application servers, adhering strictly to PCI-DSS standards via authorized gateways.

3.3 Usability

The user interface must follow modern user experience principles, prioritizing simplicity and visual clarity. Drivers must be able to complete a parking space reservation in fewer than four intuitive steps. Forms should provide clear, instantaneous inline validation messages to guide user input accurately. The layout must follow high-contrast readability standards, utilizing clean black-and-white typography and legible typography for effortless outdoor mobile viewing.

3.4 Reliability and Availability

ZENO must ensure high system reliability to support drivers needing round-the-clock parking access. The web application should maintain an operational uptime of at least 99.5% outside scheduled maintenance windows. Database transactions for slot reservations must follow ACID principles to avoid race conditions or phantom bookings. Automated daily database backups must be maintained to ensure rapid disaster recovery in case of hardware failures.

3.5 Maintainability and Scalability

The application codebase must be structured modularly, separating route handlers, business logic controllers, and database models. Both frontend and backend components should follow consistent coding conventions and clear architectural boundaries. The system must support horizontal scaling by deploying backend Express instances behind load balancers when traffic increases. MongoDB collections must be organized to allow smooth sharding as the platform expands into new geographical territories.

4 Class Diagram

The class diagram below outlines the core domain entities of the ZENO platform and their mutual associations. It details the structural relationships between Users, Vehicles, Buildings, Parking Slots, Bookings, Invoices, Payments, Subscriptions, and Penalty records.

Figure 1: ZENO Domain Entity Class Diagram

5 Tools and Technologies

5.1 Frontend Technologies

- **React 19:** Component-based user interface library used to build a reactive and modular Single Page Application (SPA).
- **Vite:** High-speed next-generation frontend build tool providing rapid Hot Module Replacement (HMR) and optimized production bundles.
- **TailwindCSS:** Utility-first CSS styling framework used to produce responsive, consistent, and clean user interfaces.
- **React-Leaflet & Leaflet:** Open-source JavaScript mapping libraries utilized for interactive geospatial visualization, building location markers, and route previewing.
- **Axios:** Promise-based HTTP client for secure, asynchronous communication between the client browser and backend RESTful APIs.
- **Lucide React & Framer Motion:** Modern icon assets and fluid animation primitives delivering polished micro-interactions and clear visual feedback.

- **React-to-Print:** Specialized client-side utility for seamless printing and physical voucher formatting.

5.2 Backend Technologies

- **Node.js:** Scalable asynchronous event-driven JavaScript runtime environment executing high-throughput backend services.
- **Express.js 5:** Robust minimalist web application framework providing RESTful API routing, middleware chaining, and HTTP request handling.
- **MongoDB & Mongoose:** Document-oriented NoSQL database coupled with Mongoose Object Data Modeling (ODM) for strict schema definition and rapid query execution.
- **JSON Web Tokens (JWT):** Stateless authentication mechanism ensuring secure, signed session tokens for verified renters and administrators.
- **Bcryptjs:** Industrial-grade cryptographic hashing library protecting stored user credentials against rainbow table and brute-force intrusions.
- **PDFKit:** Dynamic server-side document generation engine that compiles transaction and booking data into downloadable PDF invoices.
- **Nodemailer:** Modular email delivery package responsible for dispatching automated booking confirmations, overstay alerts, and receipts.
- **Stripe Gateway Integration:** Secure merchant payment processor facilitating encrypted credit card, debit card, and mobile banking transactions.

6 Compatibility with System Environment or OS

ZENO is designed with universal compatibility in mind, leveraging modern cross-platform web standards. On the client side, the platform operates independently of the client operating system. It runs flawlessly on all contemporary web browsers—including Google Chrome, Mozilla Firefox, Apple Safari, and Microsoft Edge—across desktop platforms (Windows 10/11, macOS, and Linux distributions) and mobile platforms (Android and iOS). This eliminates the friction of native app installations while ensuring responsive usability on screens of any dimensions.

On the server side, the backend runtime relies on Node.js, which guarantees smooth deployment across diverse enterprise server environments. It is fully compatible with standard Linux distributions (such as Ubuntu Server, Debian, and Red Hat Enterprise Linux), Windows Server environments, and containerized Docker environments. The database layer runs natively on local or cloud-managed MongoDB Atlas clusters, ensuring seamless infrastructure portability and consistent performance across production environments.

7 Implementation: Feature Screenshots

This section contains visual interfaces and dedicated placeholders across the functional features of ZENO, organized sequentially according to the end-to-end user lifecycle and facility administration workflow.

7.1 Home and Landing Page

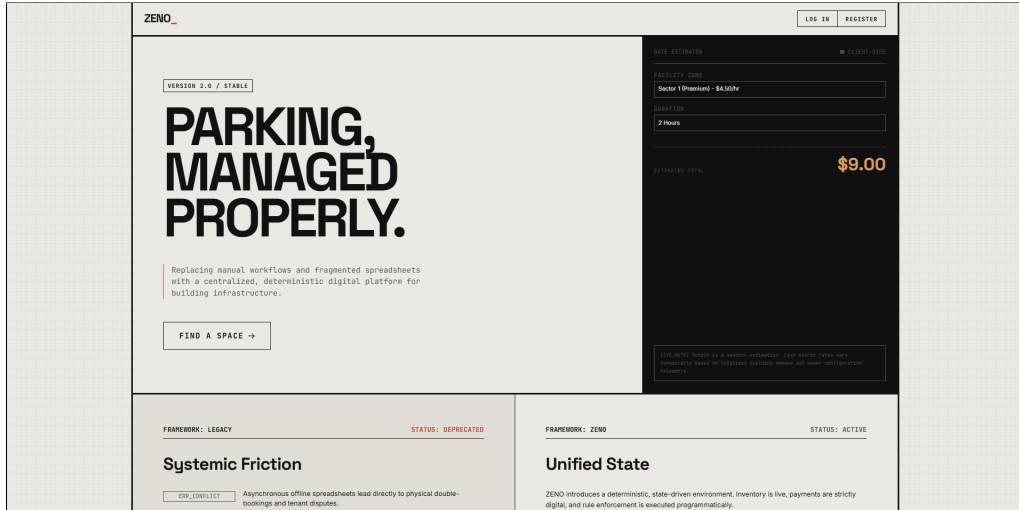

Figure 2: ZENO Public Landing Page and Platform Overview

Description: The landing page welcomes visitors with real-time parking zone rates, platform feature summaries, and direct calls to action for renters and space owners.

7.2 User Authentication and Registration

Figure 3: User Login and Session Authentication Screen

The image shows a web browser window with the ZENO_ logo in the top left and 'LOG IN' and 'REGISTER' buttons in the top right. The main content area features a 'NEW_ACCOUNT' modal window titled 'REGISTER'. This modal contains the following fields: 'NAME' (with 'Jane Doe' entered), 'EMAIL' (with 'name@domain.com' entered), 'PASSWORD' (with '*****' entered), and 'ACCOUNT TYPE' (a dropdown menu showing 'Renter - Book parking slots'). A 'REGISTER' button is at the bottom of the modal. Below the button, a link says 'ALREADY HAVE AN ACCOUNT? LOG IN'. The footer of the browser window shows 'ZENO_ | © 2020 ZENO PLATFORM', a barcode, and 'SYS_ARCH // 2020'.

Figure 4: New User Registration and Account Creation Screen

Description: The authentication screens allow drivers and property managers to securely access the platform or register new accounts. They enforce input validation and issue JSON Web Tokens for role-based session control.

7.3 Renter Profile and Vehicle Management

The image shows a 'DASHBOARD' for a user logged in as 'RENTER'. The dashboard includes a left sidebar with navigation links: DASHBOARD, VEHICLES, BROWSE SLOTS, BOOKINGS, RECURRING BOOKINGS, NAVIGATION, CHECK-IN / CHECK-OUT, OVERTAY PENALTIES, INVOICE VIEWER, PAYMENTS, SUBSCRIPTIONS, RATINGS & REVIEWS, REPORTS, and NOTIFICATIONS. The main content area displays:

- A welcome message: 'WELCOME BACK, MAZIDI' with 'ACTIVE ACCOUNT: MAZID@ZENO.COM'.
- Three summary cards: 'TOTAL BOOKINGS [14]', 'TOTAL SPENDING \$350', and 'TOTAL DRIVEN [8]'.
- A 'MY VEHICLES' section showing a table with one vehicle: 'DHAKA-METRO-6A-1235' (LIVE - RENT) and 'ABC123' (SPORTS - LARGE).
- An 'AVERAGE GIVEN RATINGS' section showing a score of '4.1' with five stars and the text 'BASED ON REVIEWS GIVEN'.

 The bottom of the dashboard shows a user profile for 'MAZIDI'.

Figure 5: Renter Overview Dashboard and Personal Statistics

Figure 6: Vehicle Registration and License Plate Management

Description: These interfaces centralize renter metrics, past booking summaries, and vehicle license plate profiles to speed up gate verification and reservation checkout.

7.4 Search and Filter System

Figure 7: Search and Multi-Criteria Filtering Interface

Description: The search and filter interface enables drivers to locate parking facilities by destination, vehicle type, and pricing parameters with instant responsive updates.

7.5 Map and Navigation

Figure 8: Interactive Map and Navigation Interface

Description: This interface displays an interactive city map with color-coded building markers indicating available parking locations. Users can click any marker to review building capacity and launch live turn-by-turn driving directions.

7.6 Listing Booking History

Figure 9: Recently Booking Listings

Description: This panel displays a chronological list of recently booked parking spots and buildings, allowing renters to revisit options without searching again. Each listing card shows current availability, hourly pricing, and quick booking access.

7.7 Bookmarks and Favourite

The screenshot shows a web application interface for 'ZENIO'. On the left is a sidebar menu with options: FILTER NAV..., DASHBOARD, VEHICLES, BROWSE SLOTS, MY SAVED SLOTS, BOOKINGS, RECURRING BOOKINGS, NAVIGATION, CHECK-IN / CHECK-OUT, OVERSTAY PENALTIES, INVOICE VIEWER, PAYMENTS, SUBSCRIPTIONS, RATINGS & REVIEWS, REPORTS, and NOTIFICATIONS. The main content area is titled 'MY SAVED SLOTS' and 'BOOKMARKED PARKING SPACES - [3 SAVED]'. It displays three cards for saved parking slots:

- SLOT A1**: BUILDING: Avengers Tower, FLOOR: 1, TYPE: STANDARD, HOUR: \$700. Button: BOOK NOW.
- SLOT A-102**: BUILDING: BRACU, FLOOR: 2, TYPE: LARGE, HOUR: \$50. Button: BOOK NOW.
- SLOT A14**: BUILDING: Gullahan Avenue Parking Tower, FLOOR: 5, TYPE: STANDARD, HOUR: \$50. Button: BOOK NOW.

Each card also has an 'UNSAVE' button in the top right corner.

Figure 10: Saved Favorite Parking Slots and Quick-Booking Screen

Description: This interface displays all bookmarked and saved parking slots, allowing drivers to quickly access their preferred parking bays across registered facilities. Each card details the bay identifier, building location, floor level, vehicle compatibility, and hourly rate, complete with instant reservation shortcuts and an unsave option.

7.8 Slot Management

The screenshot shows a web application interface for 'ZENIO'. On the left is a sidebar menu with options: FILTER NAV..., DASHBOARD, MY SLOTS, SLOT BOOKINGS, INVENTORY PENALTIES, REPORTS, and NOTIFICATIONS. The main content area is titled 'ZENIO' and has tabs: DASHBOARD, MY SLOTS, ZONER, and Logout. A modal window titled 'CREATE PARKING SLOT' is open, with a 'CANCEL' button in the top right corner. The form contains the following fields:

- BUILDING**: A dropdown menu with the text '- Select a building -' and a list of buildings below it.
- SLOT NUMBER**: A text input field with the value 'A-102'.
- FLOOR**: A text input field with the value '1'.
- SLOT TYPE**: A dropdown menu with the value 'STANDARD'.
- LENGTH (FT)**: A text input field.
- WIDTH (FT)**: A text input field.
- RATE / HOUR**: A text input field.
- RATE / DAY**: A text input field.
- RATE / MONTH**: A text input field.
- CREATE SLOT**: A large black button at the bottom.

Figure 11: Parking Slot Creation and Spatial Parameter Configuration Form

Description: Facility administrators use this form to register and configure individual parking bays within a property, specifying slot designations, vehicle type compatibility, physical dimensions, and hourly, daily, and monthly base rental rates.

7.9 Bookings Feature

Figure 12: Parking Facility Search and Building Availability Selection Screen

Figure 13: Building Bay Expansion and Individual Slot Availability Screen

Figure 14: Slot Reservation Modal with Hourly Timeline Grid and Confirmation

Description: The booking module guides renters through an intuitive multi-step reservation process directly from managed slot interfaces: discovering available facilities, expanding building listings to inspect specific bays, and picking reservation hours on the 24-hour availability schedule before finalizing their booking.

7.10 Dynamic Pricing

Figure 15: Dynamic Pricing Rules Dashboard and Quick-Start Templates

CREATE PRICING RULE

PLEASE REMEMBER: THE BASE SLOT PRICE BY TYPE, FLOOR, TIME, AND DEMAND.

RULE NAME: High Demand Surge

Figure 19: Detailed Electronic PDF Invoice Viewer

Description: The invoice screens provide a comprehensive billing ledger and an integrated PDF viewer for individual transactions, enabling renters and managers to audit charges and download formal tax receipts.

7.13 Subscription

Figure 20: Available Recurring Subscription Packages Selection

Figure 21: Active Subscription Management and Pass Status

Description: These screens demonstrate the subscription lifecycle, allowing daily commuters to evaluate recurring parking passes and subsequently monitor their active subscription status, assigned bay, and renewal dates.

7.14 Check In/Out

Figure 22: Vehicle Check In and Check Out Interface

Description: This interface allows gate attendants to verify arriving vehicles, record check-in timestamps, and validate vehicle check-outs against reserved time slots. It automatically flags overstays and confirms gate clearance once any pending fees are settled.

7.15 Overstay Detection and Penalty System

The screenshot shows the ZENO application interface for overstay penalties. The left sidebar is the same as in Figure 22. The main content area is titled 'OVERSTAY PENALTIES' and includes a sub-header '[1 RECORDS]'. There is a 'SYNC HEADOUT' button. Below this, there is a table with the following columns: BOOKINGID, OVERSTAYDURATION, PENALTYAMOUNT, PENALTYRATEPERHOUR, NOTES, CREATEDAT, UPDATEDAT, and ACTIONS. The table contains one record:

BOOKINGID	OVERSTAYDURATION	PENALTYAMOUNT	PENALTYRATEPERHOUR	NOTES	CREATEDAT	UPDATEDAT	ACTIONS
6a9d81c1177820970a35f9057	277	4847.5	1050	Overstay of 277 minutes beyond booked and T.L.	2024-09-06T12:40:08.422Z	2024-09-06T12:40:08.422Z	PAY

Figure 23: Overstay Tracking and Penalty Processing Screen

Description: This panel highlights overdue vehicles exceeding their reserved window and tallies automated penalty surcharges. It notifies both the driver and the facility attendant to facilitate rapid slot clearance.

7.16 Reviews and Ratings

BOOKING ID	SLOT	DATE	TOTAL PRICE	RATING
6a9dPc3e0d3a7e9b711572	A-101 Bracu	03 Sept 2026	\$200	★★★★★

Figure 25: Renter Booking History and Reservation Ledger Screen

Description: The booking history screen lists all upcoming, active, completed, and cancelled reservations alongside itemized costs and payment statuses. Renters can view booking summaries, download PDF receipts, extend parking durations, or cancel reservations directly from this interface.

7.18 Notification and Alert System

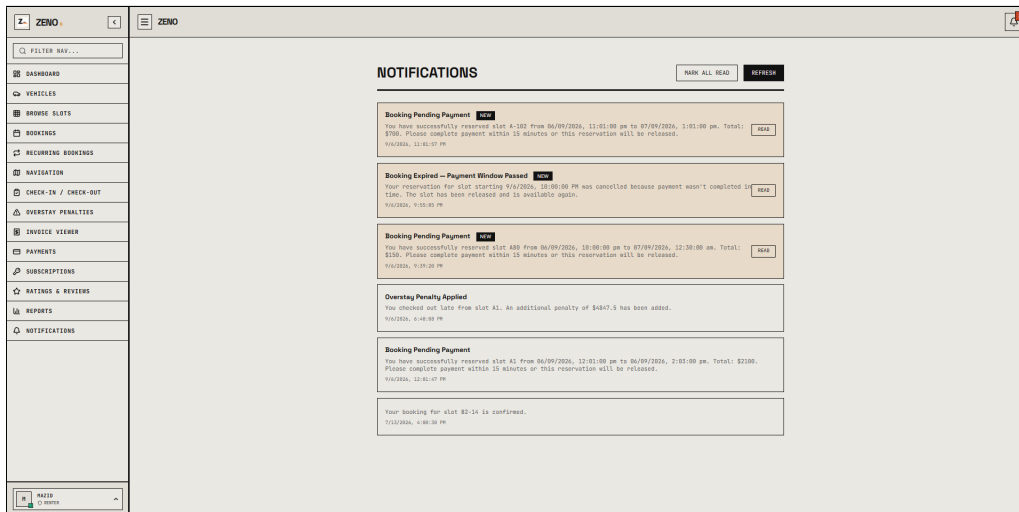

Figure 26: In-App Notifications and Activity Alerts Drawer

Description: This drawer displays real-time updates regarding booking confirmations, payment completions, and upcoming session expirations. Critical notifications are also forwarded via automated email dispatch.

7.19 Owner Dashboard

Figure 27: Owner Property and Earnings Dashboard

Description: The owner dashboard provides facility hosts with a centralized overview of live slot occupancy, daily earnings, and upcoming reservations across their properties. It allows property owners to manage operations and monitor revenue streams without switching screens.

7.20 Reports and Export System

Figure 28: Analytical Revenue Reports and CSV/Excel Export Center

Description: Property managers can review revenue trends and slot occupancy curves over custom time frames, with full export capabilities to CSV and Excel for accounting audits.

7.21 Admin Control Panel

Figure 29: Admin Control Panel: System Metrics, Capacity, and Revenue Overview

Figure 30: Admin Control Panel: Platform User Directory and Account Governance

Figure 33: Admin Control Panel: System-Wide Booking Operations and Reservation Audit

Description: The Admin Control Panel provides super-administrators with complete operational governance across the platform. It includes modular management views for real-time ecosystem analytics, user role administration, property and facility verification, parking slot registry oversight, and centralized booking audits with administrative cancellation controls.

8 Challenges

Developing a real-time, multi-tenant parking marketplace introduces several technical and architectural hurdles. One significant challenge is preventing race conditions during concurrent bookings, where two drivers attempt to reserve the same parking slot simultaneously. This requires implementing transactional locking mechanisms at the database level to ensure atomic status updates.

Another demanding task is the automated overstay detection engine, which must run scheduled cron routines to compare checkout times without causing CPU bottlenecks. Additionally, integrating third-party map tiles and synchronizing location markers smoothly across varying network speeds demanded careful client-side state caching. Lastly, building a reliable server-side PDF generator capable of rendering consistent invoice layouts across international character sets required rigorous formatting precision.

9 Conclusion

ZENO provides an effective, full-stack digital solution for the widespread challenges of urban parking management. By connecting property owners with daily commuters through an intuitive web interface, it converts underutilized parking assets into productive revenue streams while removing driver parking stress. The platform consolidates map navigation, automated billing, transparent user reviews, and disciplined overstay monitoring into a cohesive workflow.

Its modular architecture guarantees that future enhancements—such as automated license plate recognition (ALPR) cameras, hardware IoT gate sensor integration, and predictive

parking availability algorithms—can be integrated smoothly. Overall, ZENO establishes a modern foundation for smart city mobility and digitized space management.
